Flashings and Weepholes Required on All Residential Brickwork

The diagram below indicates location where through-wall flashing and weepholes are required. Construction details are on the other side of this bulletin.

Note: Although brick veneer, wood frame construction has proven to be the most durable form of protecting a house from weather, wind-driven rain can penetrate the best brickwork. Southern Brick Institute strongly recommends compliance with the flashing and weephole requirements of the Cabo and Standard Building Codes.

*CABO 703.7: Standard Building Code 1403.1*
